Repetition Statements (Loop Statements)

1. Counter-Control Loop
2. Condition-Control Loop

Three Types of Programmatic Loops
1. for-loop (predetermined number of repetitions)
2. do...while loop (will repeat at least once)
    1. Performs action first and then tests if it should keep going
3. while loop (checks first before performing any actions)

Best Practices:

for-loop is best suited for counter-control loop
do...while and while loop are best suited for condition-control loops

Incrementing:

count += (any value)
count++ (incrementing by 1)
